

# **SpotDRAFT - Junior Integration Assignment**

## **Integration between Asana and Airtable -**

### Summary

A marketing agency uses Asana for project management and tasks tracking, and Airtable for storing and analyzing data. The agency is facing challenges in maintaining a seamless workflow between project management and data organization. They cannot manually copy over the data from Asana to Airtable and we need to build out an integration that will copy the tasks from Asana to Airtable.

### Requirements

Build out a service in the language/framework of your choice that will integrate between Asana and Airtable. The requirement here is that whenever a new task is created on Asana then we need to copy that task over to Airtable. The task created in Asana needs to be stored as a new row in an Airtable table called "Asana Tasks" and it needs to have the following columns:

- Task ID
- Name
- Assignee
- Due Date
- Description

#### Hints:

- In order to trigger the integration whenever a new task is created on Asana you can make use of webhooks (ref [here](#))
- In order to write a new record to Airtable you can make use of their APIs (ref [here](#))

### Please submit -

- Code of the service uploaded to a Github with appropriate documentation
- Video showcasing how the integration is working
